

HTML Seite einlesen

Mit dieser Function kann man (externe) HTML Seiten einlesen

```
//function to get the remote data
function url_get_contents ($url) {
    if (function_exists('curl_exec')){
        $conn = curl_init($url);
        curl_setopt($conn, CURLOPT_SSL_VERIFYPEER, true);
        curl_setopt($conn, CURLOPT_FRESH_CONNECT, true);
        curl_setopt($conn, CURLOPT_RETURNTRANSFER, 1);
        $url_get_contents_data = (curl_exec($conn));
        curl_close($conn);
    }elseif(function_exists('file_get_contents')){
        $url_get_contents_data = file_get_contents($url);
    }elseif(function_exists('fopen') &&
function_exists('stream_get_contents')){
        $handle = fopen ($url, "r");
        $url_get_contents_data = stream_get_contents($handle);
    }else{
        $url_get_contents_data = false;
    }
    return $url_get_contents_data;
}
```

So sieht es dann in Aktion aus:

```
$data = url_get_contents("http://www.google.com");
if($data){
    //Do Something....
}
```

eingelassenen HTML Quelltext anzeigen lassen:

```
echo "<pre>".htmlentities($data)."</pre>";
```
